Preventing Heart Disease and Stroke
HEART DISEASE IS...

The #1 Killer for All Americans

1 in 4 African-Americans die from heart disease.
1 in 6 American Indians and Alaska Natives die from heart disease.
1 in 5 Latinos die from heart disease.
Cardiovascular diseases, which includes stroke, claim the life of a woman about every 80 seconds. But about 80 percent of cardiovascular diseases may be prevented.
Can you have a heart attack and not know it?
Symptoms of a Silent Heart Attack

Just like the name implies, a silent heart attack is a heart attack that has either:

- no symptoms,
- minimal symptoms or
- unrecognized symptoms

But it is like any other heart attack where blood flow to a section of the heart is temporarily blocked and can cause scarring and damage to the heart muscle.”
Silent Heart Attack

“People who have these so-called silent heart attacks are more likely to have non-specific and subtle symptoms, such as:

- indigestion or
- a case of the flu, or
- they may think that they strained a muscle in their chest or their upper back.
- It also may not be discomfort in the chest, it may be in the jaw or the upper back or arms.”
Risk Factors for a Silent Heart Attack in Women

The risk factors for a silent heart attack are the same as those for a recognized heart attack, and:

- include **high blood pressure**
- **high cholesterol**
- smoking
- **family history of heart disease**
- obesity
- age
How to Prevent a Silent Heart Attack

• know their risk factors,
• be aware of your blood pressure and cholesterol,
• exercise regularly and
• avoid smoking to decrease their risk of a heart attack.
• Above all, listen to your bodies, and if something isn’t right, talk to a doctor.

The more a woman knows about heart disease, the better chance she has of beating it.
HEART ATTACK SYMPTOMS: MEN VS. WOMEN

The most common symptom of a heart attack for both men and women is chest pain. But women may experience less obvious warning signs.

**MEN**
- Nausea or vomiting
- Jaw, neck or back pain
- Squeezing chest pressure or pain
- Shortness of breath

**WOMEN**
- Nausea or vomiting
- Jaw, neck or upper back pain
- Chest pain, but not always
- Pain or pressure in the lower chest or upper abdomen
- Shortness of breath
- Fainting
- Indigestion
- Extreme fatigue

*Source: American Heart Association’s journal, Circulation. Published April 4, 2019 | © 2019 American Heart Association, Inc.*

CARDIAC ARREST VS. HEART ATTACK

**WHAT IS CARDIAC ARREST?**
Cardiac arrest occurs when the heart malfunctions and stops beating unexpectedly.

A heartbeat is a "electrical" problem.

**WHAT HAPPENS**
Seconds later, a person becomes unresponsive, is not breathing or is only gasping. Death occurs within minutes if the victim does not receive treatment.

**WHAT TO DO**
- Cardiac arrest can be reversible in some victims if it’s treated within a few minutes. First, call your local emergency number and start CPR right away. Then, if an Automated External Defibrillator (AED) is available, use it as soon as possible.
- If two people are available to help, one should begin CPR immediately, while the other calls your local emergency number and finds an AED.

**CARDIAC ARREST is a LEADING CAUSE OF DEATH.**
Cardiac arrest affects thousands of people annually with about three quarters of them occurring in the home.

**WHAT IS A HEART ATTACK?**
A heart attack is a "circulation" problem.

**WHAT HAPPENS**
Symptoms of a heart attack may be immediate and may include intense discomfort in the chest or other areas of the upper body, shortness of breath, cold sweats, and/or nausea/vomiting. More often, though, symptoms start slowly and persist for hours, days or weeks before a heart attack. Unlike with cardiac arrest, the heart usually does not stop beating during a heart attack. The longer the person goes without treatment, the greater the damage.

**WHAT TO DO**
- Even if you’re not sure it’s a heart attack, call your local emergency number. Every minute counts. If it’s better to call your local emergency number to get to the emergency room right away.
- Emergency medical services (EMS) staff can begin treatment when they arrive—up to an hour sooner than if someone gets to the hospital by car. EMS staff can also train someone whose heart has stopped.

**WHAT IS THE LINK?**
Most heart attacks do not lead to cardiac arrest. But when cardiac arrest occurs, heart attack is a common cause. Other conditions may also disrupt the heart’s rhythm and lead to cardiac arrest.

**FAST ACTION CAN SAVE LIVES.**

Fatty deposits called plaque build up in the walls of the coronary arteries.

If the plaque becomes unstable and ruptures, the clotting process, called thrombosis, starts inside the artery.

As thrombosis continues, blood supply to the heart muscle is reduced. And muscle tissue can start to die.

If the clot completely blocks the coronary artery, all muscle tissue below the blockage can die.

Dead cardiac muscle tissue (myocardial infarction)
Risk Factors That Can Be Managed

You can control or treat these risk factors with lifestyle changes and your healthcare provider's help:

- High blood pressure
- Smoking
- High blood cholesterol
- Lack of regular activity
- Obesity or overweight
- Diabetes
Risk Factors You Can't Control

You can't change these risk factors:

- Age
- Gender
- Heredity (family health history)
- Race
- Previous stroke or heart attack
Coronary calcification is a marker for coronary atherosclerosis (hardening of plaque).

The more calcium buildup the more likely is that there is obstructive coronary disease.

How Is Blood Flow Blocked?

Coronary arteries supply blood and oxygen to the muscles of the heart.
What is a Stroke?

[Diagram showing the brain with labeled arteries: Anterior Cerebral Artery, Middle Cerebral Artery, Posterior Cerebral Artery, Ophthalmic Artery, Basilar Artery, Internal Carotid Artery, Vertebral Artery]
Blood Flow in Normal and Blocked Arteries

NORMAL ARTERY
Blood flows easily through a clear artery.

BLOCKAGE
An artery can become blocked by plaque (a fatty substance in the wall of the artery) or a blood clot, which reduces blood flow to the brain and causes a stroke. This picture shows atherosclerosis, a hardening of the arteries. Atherosclerosis is caused partly by cholesterol or plaque buildup.
CLOT DISSOLVES

A transient ischemic attack or TIA has the same signs and symptoms of a stroke, but they only last a short time. The plaque or blood clot breaks up and blood flow is restored to the brain and there is no permanent damage. A TIA is serious and needs to be evaluated by a health care provider.
Ischemic Stroke

Cardiovascular System

Blood Clot
Transient Ischemic Attack (TIA)

- Interior Cerebral Artery
- Middle Cerebral Artery
- Internal Carotid Artery
- Blockage
Intracerebral Hemorrhage

- Normal Vessel
- Bulging Vessel
- Burst Vessel
Moving and Sensing Things

- Face
- Hand
- Arm
- Fingers

**Stroke Symptoms**

Beyond F.A.S.T., other symptoms you should know include:

- **Sudden numbness** or weakness of face, arm or leg, especially on one side of the body
- **Sudden confusion**, trouble speaking or understanding speech
- **Sudden trouble seeing** in one or both eyes
- **Sudden trouble walking**, dizziness or loss of balance or coordination
- **Sudden severe headache** with no known cause
Life’s Essential 8

1. Get Active
2. Eat Better: Choose foods that are low in saturated fat, trans fat, cholesterol, and salt.
3. Lose Weight: And keep your weight under control.
4. Stop Smoking: And avoid other people’s tobacco smoke.
5. Control Cholesterol
6. Control Blood Pressure: And treat high blood pressure if you have it.
7. Reduce Blood Sugar: And control your blood sugar if you have diabetes.
8. Get Adequate Sleep: Most adults need 7-9 hours of sleep each night. Children require more and varies depending on their age.
"People should reduce use of mobile devices or TV viewing before sleep to improve sleep regularity and maximize cardiometabolic benefits."
8 STEPS TO PREVENT HEART DISEASE AND STROKE

These key factors can help you live a longer, healthier life and reduce your risk of heart disease and stroke. They’re part of an overall healthy lifestyle and prevention approach you can build with your health care team (doctors, nurses, pharmacists and other professionals).

1. Know your risk
   - If you’re 40-75 years old and have never had a heart attack or stroke, use our Check, Change, Control. Calculator™ to estimate your risk of a cardiovascular event in the next 10 years.
   - Certain factors can increase your risk, such as smoking, kidney disease or family history. Many risk factors can be improved with lifestyle changes.

2. Eat a healthy diet
   - Center your eating plan around vegetables, fruits, whole grains, legumes, nuts, plant-based proteins, lean animal proteins and fish.
   - Limit sweetened drinks, refined carbohydrates, added sugars, processed meats, sodium and saturated fats. Avoid trans fat.

3. Be physically active
   - Adults should aim for at least 150 minutes of moderate-intensity aerobic activity or 75 minutes of vigorous activity each week.
   - If you’re already active, increase your intensity for more benefits.
   - If you’re not active now, get started by sitting less and moving more.

4. Watch your weight
   - If you’re overweight, lose weight by eating fewer calories and moving more.
   - Check your body mass index (BMI) online or talk to your team about a healthy weight for you.

5. Live tobacco-free
   - Don’t smoke, vape or use tobacco products.
   - If you don’t think you can quit for good on your own, ask for help.
   - Avoid secondhand smoke, too.

6. Manage conditions
   - Work closely with your health care team if you have high blood pressure (hypertension), high cholesterol, diabetes or other conditions that put you at greater risk.
   - Many conditions can be prevented or managed by eating better, getting active, losing weight and not smoking.

7. Take your medicine
   - Your doctor may prescribe statins or other medications to help control blood sugar, cholesterol, and blood pressure. Take all medications as directed.
   - Don’t take daily aspirin unless your doctor tells you to.

8. Be a team player
   - Your health care team can help you build a prevention plan that works for you.
   - Make decisions together. Ask questions.
   - Talk about challenges in your life that may affect your health – like stress, sleep, mental health, family situations, tobacco use, food access, social support and more.

Take charge of your health.
Start today at heart.org/prevention.
Cholesterol is a fatty substance found in the bloodstream and in all your body’s cells. It’s made by the liver and is needed for the body to function normally.

The body is generally able to make all the cholesterol it needs to keep healthy.

Triglycerides, which are produced in the liver, are another type of fat found in the blood and in food.
What Causes High Blood Cholesterol?

• Inactivity*
• Obesity*
• Diet*
• Age
• Family history
A fatty streak develops between layers of artery wall.

Muscle cells in the artery wall

Inflammatory cells (macrophages) engulf deposited cholesterol.

Macrophages become giant foam cells.
Family History and Cholesterol

- Cholesterol is a waxy substance that comes from your body or from certain foods.
- High cholesterol is associated with heart disease and can have a genetic component.
- The different types of cholesterol are:
  - **Dietary cholesterol**: Comes from animal sources such as poultry, meat or dairy
  - **LDL (low-density lipoprotein) cholesterol**: Considered the bad cholesterol because it can cause atherosclerosis, which is clogging of the arteries
  - **HDL (high-density lipoprotein) cholesterol**: Considered good cholesterol because it removes LDL from your body
  - **Serum cholesterol**: The total amount of cholesterol in the bloodstream
FAMILIAL HYPERCHOLESTEROLEMIA (FH)

- Those who have familial hypercholesterolemia (FH) inherit a defect in how the body recycles LDL (bad) cholesterol.

- FH causes LDL levels in the blood to remain extremely high (more than 190 milligrams per deciliter).
Familial Hypercholesterolemia Effects

1 in 250 adults (834K people) have been diagnosed with the FH genetic mutation.

Men with FH

- Develop coronary heart disease **20 years earlier**.
- Half of men with untreated FH have a heart attack or angina before age 50.

Women with FH

- Develop heart disease **30 years earlier**.
- About 30% of women with the condition have a heart attack before age 60.
▪ **Total Cholesterol**
  ▪ Less than 200 mg/dL Desirable
  ▪ 200–239 mg/dL Borderline high
  ▪ 240 mg/dL and above High

▪ **LDL Cholesterol**
  ▪ Less than 100 mg/dL Optimal (ideal)
  ▪ 100–129 mg/dL Near optimal/above optimal
  ▪ 130–159 mg/dL Borderline high
  ▪ 160–189 mg/dL High
  ▪ 190 mg/dL and above Very high

▪ **HDL Cholesterol**
  ▪ Less than 40 mg/dL Major heart disease risk factor
  ▪ 60 mg/dL and above Gives some protection against heart disease
Changing unhealthy behaviors is very important for those who have risks factors.

The good news is that people can prevent or lower their risk for heart disease and stroke by choosing *healthy lifestyle habits and behaviors*, such as:

- eating healthy foods,
- becoming more physically active,
- keeping or reaching a healthy body weight,
- and not using tobacco.
# Challenge Yourself to Eat More Color

COMMUNITY NEED

But, *most* of us don’t eat enough fruits and vegetables to meet our body’s needs:

- **About 75%** of the U.S. population has an eating pattern that is low in fruits and vegetables.
- **Only 1 in ten** adults meets the recommendations for fruit and vegetable consumption.
- **Men and younger adults** eat the fewest fruits and vegetables.
Diabetes and High Blood Pressure
What is Diabetes?

Diabetes is a disease in which the body does not produce or properly use insulin.
POINT 1: It’s Time to Rethink Your Drink

Sugary drinks are the single largest source of added sugars in the American diet.

Sugary drinks are a major contributor to the increasing rates of heart disease and diabetes. They also may influence cognitive functioning.
HEALTH IMPACT FROM SUGAR Y DRINKS

People who regularly drink sugary drinks, like sweetened teas, energy drinks and soda, are at increased risk of:

- Heart disease
- Type 2 diabetes
- Excessive weight gain
- Obesity
- Tooth decay
AHA’S SUGAR RECOMMENDATIONS

Daily Sugar Limits for Adults

For Women:
100 calories or 6 teaspoons/25 grams (or less)

For Men:
150 calories or 9 teaspoons/36 grams (or less)
AHA’S SUGAR RECOMMENDATIONS

Daily Sugar Limits for Children

For Children, over age 2:
Less than 6 teaspoons

Children should drink no more than one 8-ounce sugary drink a week.
TOO MUCH SUGAR

Most Americans consume nearly 20 teaspoons of added sugars every day.

1 teaspoon of sugar = 1 sugar packet = 1 sugar cube

That’s more than TRIPLE the recommended daily limit for women and DOUBLE for men!
TOO MUCH SUGAR

10 teaspoons of added sugar in an average 12-ounce can of soda

14 teaspoons of added sugar in an average 16-ounce energy drink

16 teaspoons of added sugar in an average 20-ounce bottle of cola
SUGAR OVERLOAD

Americans consume about 34 pounds of added sugar every year just from sugary drinks.

Every week children are having up to 10 times more sugary drinks than the AHA recommends.

Nearly 50 percent of children ages 2 to 5 have at least one sugary drink daily.
CHECK THE NUTRITION FACTS LABEL

Look for added sugars under "Total Sugars".

Added sugars go by sneaky names:

- Sucrose
- Glucose
- Maltose
- Dextrose
- High Fructose Corn Syrup
POINT 1: Sodium and Your Health

Sodium and Your Body

- Your body needs some sodium to work properly.
- Too much sodium causes your body to hold onto water. This puts an extra burden on your heart and blood vessels.
- Most of the sodium we consume is in the form of salt.
Too much sodium also puts you at risk for:

- Enlarged heart muscle
- Headaches
- Kidney disease
- Osteoporosis
- Stroke
- Heart failure
- Kidney stones
- Stomach cancer
Did You Know?

- Nine out of 10 Americans consume too much sodium.
- Sodium added to food outside the home accounts for more than two-thirds of total sodium intake in the U.S.
- More than 70% of sodium consumed is from processed, packaged and restaurant foods.
How Much is Too Much?

- Most adults consume more than 3,400 milligrams (mg) of sodium a day.
- The American Heart Association recommends no more than 2,300 mg a day, moving toward an ideal limit of no more than 1,500 mg per day for most adults.
- Even cutting back by 1,000 mg a day can improve blood pressure and heart health.
<table>
<thead>
<tr>
<th>SODIUM</th>
<th>SALT</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sodium is a mineral that’s essential for life.</td>
<td>Table salt is about 40% sodium and 60% chloride.</td>
</tr>
<tr>
<td>Sodium helps your body work.</td>
<td>Salt and sodium are commonly used interchangeably.</td>
</tr>
<tr>
<td>It helps to control your body’s fluid balance.</td>
<td>To find out the amount of “salt” in a food, check the “sodium” content on the label.</td>
</tr>
<tr>
<td>Sodium also helps send nerve impulses and affects muscle function.</td>
<td></td>
</tr>
</tbody>
</table>
Did you know?
These six popular foods can add high levels of sodium to your diet.

- Breads and rolls
- Pizza
- Sandwiches
- Cold cuts and cured meats
- Soup
- Burritos and tacos
WHERE DOES THE SODIUM WE EAT COME FROM?

Most of the sodium we eat comes from packaged, processed and restaurant foods.

- **Processed foods** are packaged in boxes, cans, or bags.
- **Packaged foods** are ready to eat, convenience items such as prepared meals, gravy mixes, canned soups, and cake mixes.
- **Restaurants** often rely on some processed foods in their food prep.

70% Comes from processed & restaurant foods

- 15% Occurs naturally
- 10% Added while cooking
HIDDEN SOURCES OF SODIUM

Ingredients such as:
- Monosodium glutamate (MSG)
- Sodium bicarbonate
- Sodium nitrate
- Sodium citrate
- Sodium glutamate
- Sodium lactate
- Sodium phosphate

Baking soda and baking powder also contain sodium.
HEALTHY DIET TIPS

Follow an overall heart-healthy diet that emphasizes:

- Variety of fruits and vegetables
- Whole-grains
- Low-fat dairy products
- Skinless poultry and fish
- Nuts and legumes
- Non-tropical vegetable oils
- Limiting saturated fat, trans fat, sodium, red meat, sweets and sugary drinks
What Is High Blood Pressure?

High blood pressure means that the heart **must pump harder** than normal for blood to get to all parts of the body.
Risk factors that can't be controlled:
- Family history
- Age
- Gender
- Race
What Causes High Blood Pressure?
Factors that contribute to high blood pressure are:

- Salt in the diet*
- Being overweight or obese*
- Lack of physical activity*
- Heavy alcohol consumption*
- Race
- Age
- Gender
- Smoking*
- Diabetes*
- Family history
American Heart Association recommended blood pressure levels

- **Normal**: Systolic < 120 and Diastolic < 80
- **Elevated**: 120-139 systolic or 80-89 diastolic
- **High Blood Pressure (Stage 1)**: 140-159 systolic or 90-99 diastolic
- **High Blood Pressure (Stage 2)**: 160-179 systolic or 100-109 diastolic
- **Hypertensive Crisis**: Systolic > 180 or Diastolic > 120

Incorrect forearm position:
- Wrist higher than heart level
- Forearm in horizontal position
- Forearm vertical and close to the body

Correct forearm position for wrist blood pressure measurement:
1. Apply the wrist device
2. Keep elbow on table or desk with forearm bent
3. Place the wrist at heart level
4. Keep arm relaxed and hand resting against your body
5. Measure wrist blood pressure without moving arm from seated position
## Blood Pressure Categories

[heart.org/bplevels](http://heart.org/bplevels)
What Are the Signs of High Blood Pressure?

- Tiredness
- Confusion
- Nausea or upset stomach
- Vision problems or trouble seeing
- Nosebleeds
- More than normal sweating
- Headache
- Dizziness
- Skin that is flushed or red, or skin that is pale or white
- Anxiety or nervousness
- Palpitations (strong, fast, or obviously irregular heartbeat)
- Ringing or buzzing in ears
- Impotence
Why Is High Blood Pressure Harmful?

- High blood pressure causes the heart to work harder than normal.
- High blood pressure increases the risk of heart attacks, strokes, kidney damage, eye damage, heart failure, and atherosclerosis.
Normal size Heart

Enlarged Heart due to HBP
Consequences of High Blood Pressure

High blood pressure is often the first domino in a chain or "domino effect" leading to devastating consequences, like:

- **STROKE**
  - HBP can cause blood vessels in the brain to burst or clog more easily.

- **VISION LOSS**
  - HBP can strain the vessels in the eyes.

- **HEART FAILURE**
  - HBP can cause the heart to enlarge and fail to supply blood to the body.

- **HEART ATTACK**
  - HBP damages arteries that can become blocked.

- **KIDNEY DISEASE/FAILURE**
  - HBP can damage the arteries around the kidneys and interfere with their ability to effectively filter blood.

- **SEXUAL DYSFUNCTION**
  - This can be erectile dysfunction in men or lower libido in women.

Control your Blood Pressure to avoid complications.

*Age-related macular degeneration

Is Vision Loss Part of Getting Older?

Vision can change as we age. Vision loss and blindness are not a normal part of aging.
What Vision Changes Are Normal?

- Focusing on objects up close is harder to do.
- Noticing declining sensitivity.
- Needing more light to see well.
- Needing more time to adjust to changing levels of light.
Vision is wonderful, but it could be lost if a person has diabetes.

This Photo by Unknown Author is licensed under CC BY-SA-NC
Diabetic Retinopathy

This picture shows an eye with swollen blood vessels from diabetic retinopathy.

Normal Vision

Diabetic Retinopathy
How is diabetic retinopathy treated?
What Is Low Vision?

Vision that is **not corrected** by eyeglasses, contact lenses, medication, or surgery.

Low vision may make everyday tasks **difficult** to do.
Sometimes vision loss occurs because of eye injuries or birth defects.

Most people develop low vision because of the following:

- Age-related macular degeneration
- Cataract
- Diabetic eye disease
- Glaucoma
Signs of Low Vision

Even with regular glasses or contact lenses, a person has difficulty with the following:

- Recognizing familiar faces
- Reading
- Cooking
- Picking out and matching the color of your clothes
- Reading street signs
Examples of low vision devices:

- Glasses with high powered lenses
- Special software for computers
- Telescopic lenses
- Other devices
Diabetes and Cataract

A cataract is a clouding of the lens. People with cataract see through a haze.
Diabetes and Glaucoma

Glaucoma is a group of diseases that can damage the optic nerve and result in vision loss and blindness.
The Eye Health Team

Health professionals who are part of an eye health team include:

• Certified diabetes educator
• **Health promoter/CHW**
• Nurse
• Ophthalmologist
• Optometrist
• Pharmacist
• Primary care provider
• Social worker
Keep your eyes healthy

There are lots of ways to keep your eyes healthy
• from wearing your sunglasses
• to eating eye-healthy foods, like salmon and kale
Protect your eyes

- Wear sunglasses
- Wear protective eyewear
- Give your eyes a rest
- If you wear contacts, take steps to prevent eye infections
Are You at Risk for Heart Disease?

Name: __________________________________________

Risk factors are traits or habits that make a person more likely to develop heart disease. Read this list of risk factors for heart disease. Check the ones you have.

Heart disease risk factors you can do something about:

✔ Check the ones that you have.

☐ Being overweight        ☐ Not sure
☐ High blood pressure    ☐ Not sure
☐ High blood cholesterol ☐ Not sure
☐ Diabetes              ☐ Not sure
☐ Not being physically active
☐ Cigarette smoking

Heart disease risk factors you cannot control:

✔ Check the ones that you have.

☐ Age (45 years or older for men and 55 years or older for women)

☐ Family history—
  • Father or brother with heart disease before age 55
  • Mother or sister with heart disease before age 65

The more risk factors you have checked, the greater your risk for heart disease. Talk to your doctor about your risk.
